

PROJECT CANVAS

Eurovision Career-Bump Effect, 2015–2025 · Marta Prandin + teammate · Albert School Data Projects

1 Title & pitch

The Eurovision Career-Bump Effect, 2015–2025.

Does placing top-10 actually launch careers — or is it a myth?

2 SMART question + hypotheses

Q: For Eurovision top-10 finishers 2015–2025, do release-frequency, label changes and chart presence increase in the years after their Eurovision finish vs. the years before?

H1: Top-3 finishers have a release-frequency bump $\geq 1.5\times$ their pre-Eurovision rate.

H2: Winners (rank 1) show a larger bump than runners-up (rank 2-3).

H3: Artists who debuted < 2 years before Eurovision get a bigger relative bump than long-active artists.

3 Audience & decision

A music journalist or A&R scout: is Eurovision a serious career launcher, or just a 3-week boost that fades?

Decision enabled: which years' winners are worth tracking; whether Eurovision is a viable platform for new signings.

4 Data sources

- MusicBrainz API — full discography per artist (~1000+ release rows).
- Wikipedia artist pages — biographical infobox (born, origin, years active, genres, labels) scraped with BeautifulSoup.
- Both join on the artist column.

5 Variables

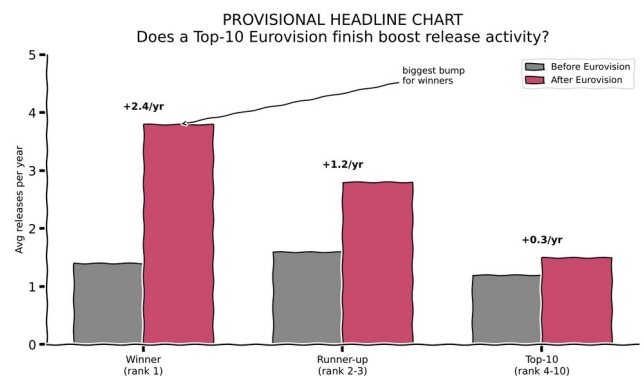

Per artist (~99 rows): artist, eurovision_year, eurovision_rank, country, born, origin, years_active, genres, labels.

Per release (~1000+ rows): artist, release_title, release_date, release_country, release_status.

Engineered: years_since_eurovision, releases_per_year_before, releases_per_year_after, bump_ratio.

6 Sketch of final chart

Before vs After bars, grouped by finish rank. (Redraw on paper for class.)

7 Risks & mitigations

- Small N (~99 artists) → bootstrap CIs, be honest in conclusions.
- Some artists have no Wikipedia page → accept ~90 successful, document failures.
- Recent artists (2024–25) have ≤ 1 year of after-data → exclude from after-analysis if needed.
- MusicBrainz misses local releases → cross-check against Wikipedia discography sections.

8 Definition of done

- Notebook runs end-to-end on a fresh machine.
- 3 polished charts (before/after by rank, individual artist timelines, genre breakdown).
- 10-min talk + 1 paragraph per hypothesis.
- Public GitHub repo with README, raw data, cleaned data.

Note: field 6 will be redrawn on paper. Image above = planning sketch with placeholder numbers (real numbers come from the Session 4 cleaning + analysis).
